

Walk Behind Road Marking Machine «Kontur 30»

General information

This machine is designed for airless method of horizontal marking in zones like parking lots and warehouses, using fast-drying traffic paints and reflective glass beads (extra option). Small dimensions of the machine enable working in city conditions without hindering traffic.

Using paint under high pressure while applying marking lines allows working with high-viscosity paints and paints with high percentage of nonvolatile content. Due to these characteristics the paint dries fast and spreads evenly while applying a full coat.

Functionality

Installation of the painting gun in the rear part of the machine allows for application of a more even line during marking. The machine has a good maneuverability due to a front turning wheel. During application of lengthwise lines on straight road stretches, the fixation of the turning wheel in the middle position is provided for operator's convenience.

Technical specifications

Paint tank capacity	30 kg
Road marking speed	up to 5 km/h
Hydraulic piston pump	4.7 l/min
Dimensions (length x width x height),m	1.5 x 0.8 x 1.1
Full weight	120 kg

One charge of the road material is enough to apply 60 m² of markings.

Additional options

- Second spray gun
- Glass beads application
- 400 mm width line (for airfield marking)
