

# Road marking machine «Kontur 50»

---

## General information

This machine is designed for airless method marking in parking zones and small city areas, using fast-drying traffic paints and reflective glass beads.

Using paint under high pressure while applying marking lines allows for working with high-viscosity paints and paints with heavy percentage of nonvolatile content. Due to these characteristics the paint dries fast and spreads evenly during full coat application.

## Functionality

Air-free method of markings application allows for achieving ultimately even edges of the applied lines. Using paint under high pressure while applying marking lines allows the material to penetrate deeply into road surface pores, sweeping fine dust off the road surface.

## Comfort

Mechanical drive and anatomic sprung seat of the machine allow for taking heavy workload off the staff. Relatively small size of the machine allows for using it during road marking application within the city, without interfering with the city traffic.

## Technical specifications

Amount of spray guns .....	2pairs
Road marking speed .....	up to 5 km/h
Maximum transportation speed .....	8 km/h
Maximum road surface slope .....	20%
Paint tank capacity.....	30 kg
Glass beads tank capacity.....	18 kg
Dimensions (length x width x height),m .....	2.3 x 0.9 x 1.1
Full weight .....	265 kg

## Additional information

Full load of road marking material is enough to apply 60 m<sup>2</sup> of markings.
